

CREATION MOMENTS

Proclaiming Evidence for Truth

THIS WEEK'S CREATION MOMENT

Are All Dinosaurs Extinct?

Read Romans 8:20-21

Dinosaurs are one of the most popular subjects among grade schoolers these days. These fascinating and awe-inspiring creatures seem distant and unreal to our modern world. Because of this, dinosaurs are often seen as proof of the idea that we live in an evolutionary world.

But are dinosaurs really extinct? Many species of dinosaurs have been discovered and classified over the years. Most of the reptiles we think of as "dinosaurs" belonged to the Archosauria or "ruling reptile" subclass. However, at least 21 species and seven subspecies of Archosauria continue to live to this day, though some of them are endangered species. The largest living group of Archosauria is the crocodiles. Most crocodiles grow to be larger than the average extinct dinosaur, which averaged about the size of a horse. Marine crocodiles found off the northern coast of Australia grow to over thirty feet in length – an accomplishment unmatched by most dinosaurs. Crocodiles help us to learn to see the extinct dinosaurs as part of God's incredible creativity rather than as symbols of an ever-changing, ever-evolving world.

But this doesn't mean that change, especially improvement, is a myth. Our Creator wants far more for us than we can achieve for ourselves. That is why He has given us His Word of salvation in Jesus Christ! In Christ is found true and worthy improvement.

Prayer: Dear Lord Jesus Christ, grant me Your instruction through Your Word that I may not only have life, but so that I may become more like You. Amen.
