

CREATION MOMENTS

Proclaiming Evidence for Truth

THIS WEEK'S CREATION MOMENT

The Amazing Mosquito Hawk

Read Job 39:26

Flight is a big problem for those who believe that we owe our existence to evolution. Birds, mammals, reptiles, insects – and even some fish – fly or at least glide through the air in controlled flight. So many different creatures fly that evolutionists must say that flight evolved several

different times. The dragonfly is among the best fliers in the animal kingdom.

The dragonfly can beat its four wings in unison or separately depending on the maneuver it wants to make. Dragonflies can fly at speeds up to 25 miles an hour and even faster. They can hover, take off backward and even make an unbanked turn.

The dragonfly eats small insects, including mosquitoes, earning it the nickname "mosquito hawk." A dragonfly can see a gnat from three feet away, fly to it, capture it and return to its original position in just over one second! One-third to one-half of its body mass is made up of flight muscles. Its two eyes have a total of 60,000 lenses and are situated so that its range of vision is nearly 360°. Dragonflies not only appear in the fossil record fully formed, but in much greater variety than today. One fossilized dragonfly was the size of a crow! Even the United States Air Force has studied the dragonfly to learn how it flies.

The dragonfly is no product of natural selection. It is clearly a specially-designed creature whose Designer understands flight better than we do. This Designer is our Creator God.

Prayer: I thank You, dear Father, for the beauty and wonder of the dragonfly. You are truly to be glorified! In Jesus' Name. Amen.

Notes: Richard Conniff, *The Lord of Time*, *Reader's Digest*, June 1999, p.142.
